

This image shows a node-linked diagram application currently under development. The green dots represent the start, the red dots represent the goal, and the white dots represent intermediate points. These are all implemented in visjs network.

What I would like you to do this time is to create a TODO list that will be synchronized with these.

The white dots should be registered as elements of the TODO list in the form of something like "TODO 1: do something" and each TODO should also display the next TODO that can be accomplished.

The implementation of visjs is not required, only the TODO list should be created.
